

ADHD –

We are conducting a study of adult **Attention Deficit Hyperactivity Disorder**. We are inviting men between the ages of 18 and 45 who have been treated with ADHD medications (e.g. Ritalin) in childhood and continue to experience significant problems with being: fidgety or restless, impulsive, easily frustrated, “spacey” or distractible, forgetful and disorganized. Participants are required to have been on an ADHD medication for at least 1 year, but to be no longer receiving this type of treatment.

Participation involves a screening diagnostic interview, a physical exam, PET* and MRI† scans, and psychological tests relevant to ADHD. Participants will receive one oral dose of Dexedrine as part of the PET scan test. Participants will be compensated for their time and inconvenience.

For more information, please call **Jennifer** or **Mariya** at **514-398-2957** or email **McGill.ADHD@gmail.com**.

This study is being conducted under the joint supervision of Drs. Benkelfat MD and Leyton PhD, both members of the McGill Department of Psychiatry.
